Washington D C. _____ B _____ GHE _____ December 14, 1943 _____

FARM EMPLOYMENT DOWN LESS THAN USUAL

With November weather generally ideal for seasonal farm work total farm employment declined less than seasonally during the month, the U. S. Department of Agriculture reported today. There were 9,519,000 persons working on farms the first of December -- only slightly below the number of workers on December 1 last year or the average employment during the period December 1, 1938-42. The seasonal decline in total farm employment during November was 11 percent compared with a 13 percent drop during the month in the 5-year period (1938-42).

The 2,250,000 hired workers estimated to be employed on farms December 1 were only 1.3 percent fewer than those hired a year earlier and 1.8 percent less than the December 1, 1938-42 average. The drop in the number of hired hands during November was only about 15 percent compared with the 20-year average decline from November 1 to December 1 of 23 percent.

Although the number of family workers fell off about 10 percent during the past month it is estimated that there were 7,269,000 such workers on farms December 1 compared with 7,272,000 a year ago and a December 1, 1938-42 average of 7,270,000. The decline during November was slightly smaller than the 11 percent decrease shown for the month again on average from 1938 through 1942.

The first week of December was generally warm and sunny but the shorter daily period of daylight naturally affected the length of the farm workday both for farm operators and hired help. On December 1, farm operators worked an average of 11.1 hours and hired help 9.4 hours compared with 12.4 and 10.2 hours respectively on September 1. Nevertheless farm operators were working nearly an hour per day longer than the 10.3 average reported on December 1, 1939 while hired help was working only slightly longer each day than they were four years ago.

In the fall harvest season (September-November) temperatures were generally favorable to farm operations. Deficiencies in precipitation, however, were widespread and in many localities the soil has been too

dry for plowing. Greatest deficiencies in precipitation during November were reported from the far Southwest, the central and southern Plains and the lower Missouri Valley. The driest November for many years occurred in Arkansas, Arizona and Oklahoma. For the entire fall season, the Northeastern States, Mississippi and Louisiana had above normal rainfall with all other sections of the country below normal. Some improvement in the soil moisture situation took place the first week of December in the Mississippi Valley, southeastern Plains, west Gulf area and Atlantic Coast States but at that time there was still a rather general need for moisture, especially in the Southeast and in the western Great Plains.

HARVESTS ABOUT COMPLETED

By December 1, harvesting operations were well in hand, with most of the late crops such as sugar beets, cotton, soybeans and potatoes almost completely gathered, and the bulk of the second largest corn crop in our history already husked. Hemp was moving rapidly to factories in the northern interior, but tobacco-stripping was delayed by too dry weather in Kentucky and Wisconsin. Barn feeding of livestock was increasing especially in northern areas. Despite the widespread expectations of "farm labor shortages" throughout the past year, this factor does not appear to have resulted in any significant damage to the 1943 crops or in more than usual losses through failure to harvest these.

In New England, the approach of winter found little to be done in the fields but there was much logging and wood-cutting and the usual cutting and hauling of Christmas trees. Snow covered the north and west sections of this region.

Outdoor work on mid-Atlantic farms was nearing a standstill on December 1, although considerable acreages of beets and carrots and some cabbage were still in the fields of western New York and not all of the corn was husked, nor all the potatoes dug, in Pennsylvania. Work was nearing completion, however, on the harvest of those crops remaining in the fields.

Corn husking and shredding were the principal farm activities throughout the Middle West with the weather generally favorable for field work. The soybean harvest was completed except in scattered areas. The completion of corn husking and soybean combining was somewhat retarded by the heavy snow cover in extreme southern Minnesota and north and west Iowa and by wet fields in South Dakota. The usual winter chores were occupying a large portion of the workers' time particularly in the midwest dairy sections where cows were mostly being housed, at least at night, and were largely barn fed. Some fall plowing during November was reported but does not appear to have progressed very rapidly in this region.

Farm work was well advanced in the South although in some sections the soil was too dry for plowing. Peanut threshing was nearing completion in Virginia, Oklahoma and Alabama and was making good progress in

North Carolina. Hog butchering was one of the most important activities on farms throughout the South. Picking, packing and shipping citrus fruit was increasing rapidly in Florida. The remnant of the cotton crop was being picked and work on the crop was confined to "scrapping" in northwest and extreme west Texas.

Most of the major crops of the West were harvested by December 1, with much fall plowing being done in many sections. Cotton harvesting increased during November in Arizona and was more than half finished in California on the first of December. During the last of November, cotton picking was interrupted by rain in southern New Mexico. Citrus picking was increasing sharply in Arizona and California, while orchard pruning was getting well under way on the Pacific Coast. The harvest of walnuts, tomatoes, beans and rice in California was about complete. Harvesting of avocados, olives and persimmons was proceeding, while harvesting of winter truck was increasing. Mexican workers who had been assigned to the sugar beet and apple districts of Washington were returned home, while other extra farm workers, there, left the farms and found employment in defense industries.

During 1943, the average number of persons employed on United States farms was estimated at 10,263,000 - one percent fewer than in 1942 and the lowest average in 35 years of record. All of the decline under 1942 occurred in the number of hired workers, whose ranks were somewhat depleted by the lure of relatively higher wages in industrial plants. The average number of hired workers dropped from 2,542,000 in 1942 to 2,406,000 in 1943 while the average number of family workers was practically unchanged at 7,857,000. Despite the record - low total farm employment, total crop production in 1943 will be about 5 percent above that of any year prior to 1942. Federally-inspected slaughter of meat animals averaged about the same as a year ago.
